

Only the best... Only from Europe...

**VISION**

INTERNATIONAL PEOPLE GROUP

# D i Guard nano — Your Personal Lifeguard!

D i Guard nano Ingredients may help to:

- Ensure protection from the effect of radiation

---

- Excrete toxins and heavy metals from the body

---

- Stimulate the activity of the immune system

---

- Stimulate the digestive processes

---

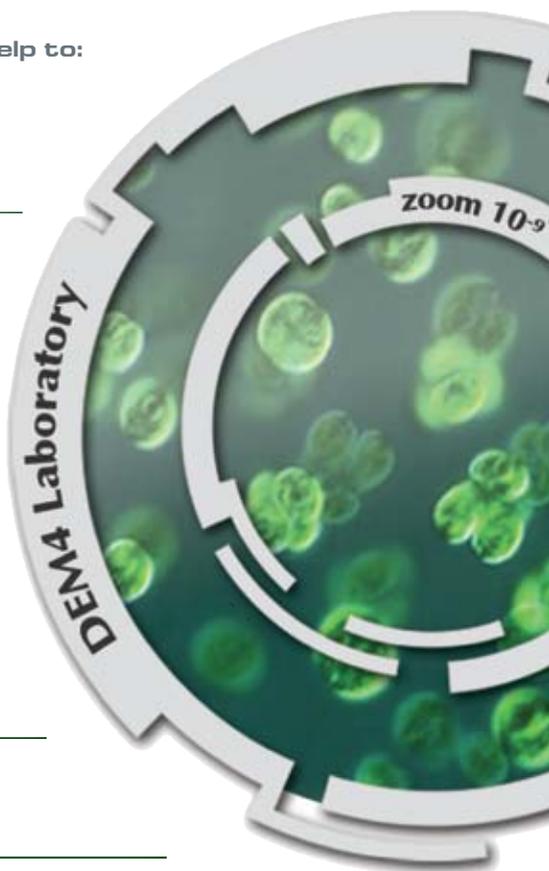

- Improve the activity of liver and gall bladders

---

- Have active regenerative features

---

- Overcome hangover syndrome

***Be healthy with Vision!***

# Invisible and Ever

Radiation... This word makes us think about cold and devastation, hospital sterility and fear of unknown. Whatever we heard about “peaceful atom”, it is the radioactive emission is the basis for the most devastating and lethal of all weapons.

The accident at Fukushima nuclear power plant and Chernobyl disaster are the darkest, but not the solitary pages in the “black book” of radioactive pollution of the Earth.

We don't want to believe, but the radiation issue more or less concerns everyone. Air and water, food and children toys, jewellery and antiques, medical examinations, especially X-rays – they all can become a source of radiation.

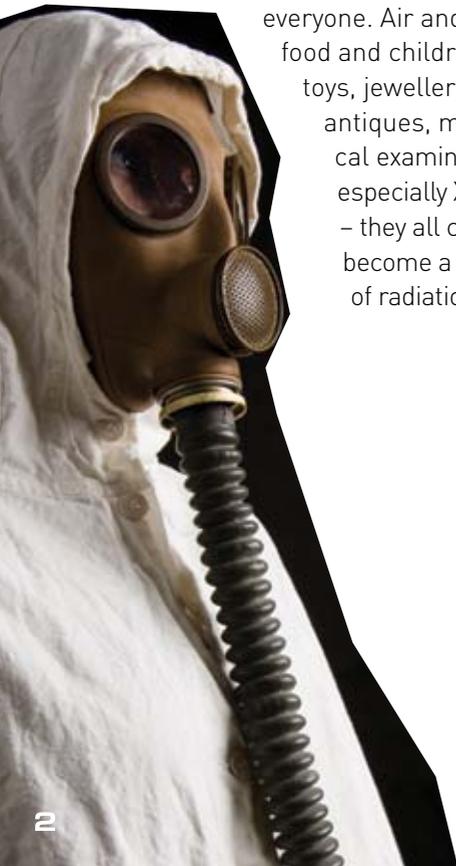

Don't forget about journeys by metro and by plane, metal detectors... Even the walls of our home (which was supposed to be our castle) can be fraught with mortal danger. **As bitterly notices one of the researchers of the radiation issue: “We are swimming in the sea of radiation and we are bearing it inside us”.**

It is commonly known that radioactivity is based on instability of nuclei of some atoms. This instability leads to nuclear decay which is accompanied by so-called ionizing radiation, i.e., radiation emission. The energy of radioactive emission is so big that it has an impact on the body cells.

**There are several types of radiation: alpha particles, beta particles, gamma emission, neutrons and X-rays. The first three types are the most dangerous for people.**

However, not only the radiation force, but also the duration of exposure affects the health.

Even an insignificant source of radiation, for instance, slightly radioactive objects affect the human health in case of long-term contact. The worst is that you won't even have any suspicions about this impact, as the radiation cannot be seen by the unaided eye, it is colourless and odourless. The guileful invisible enemy can penetrate the body through intestines, lungs or skin. In case there is

# present Enemy!

no dosage meter (a special device that measures the radiation level) at hand, we can only guess what calamity is in store for us.

it is colourless and odourless. The guileful invisible enemy can penetrate the body through intestines, lungs or skin. In case there is no dosage meter (a special device that measures the radiation level) at hand, we can only guess what calamity is in store for us.

**Soil** We don't suspect about the existence of radioactive landfills within the limits of the city, although new sources of radiation are found in cities with discouraging regularity. Moreover, adventurous developers construct residential districts on some radioactive landfills. For instance, about twenty sites with the radiation by 150 times higher than normal were found several years ago at the eventual construction site. The owners of country houses and summer houses are also exposed to risk – complaints about ill-health are often connected with contaminated soil.

**Food** Ruddy apples, sweat pears, ripe strawberries, meat, poultry, mushrooms and berries – every year tons of contaminated products are withdrawn by specialists in city markets (and we can only guess how many dangerous products escape notice of the institutions of radiological and hygienic control and end up on our tables!). According to researches, up

to 70% of radiation accumulated in the body was received in food and water.

**Children toys** It turns out that rabbits, cars, teddy bears and other toys are not the best present for kids. There was a big scandal in one of Moscow markets when it was discovered that the level of radioactivity in a lot of cuddly toys was 20 times higher than normal! This was caused either by poor-quality colour and plastic with elevated radiation background or storage or production in contaminated areas.

**Jewellery** A favourite pendant or a necklace can also constitute a serious danger: radioactive emission is used in some modern gem processing technologies.

**Antiques** Another eventual source of radiation. In 1940s-1960s toys, souvenirs and jewellery were often covered with luminous colour contained radioactive elements, but wineglasses and shot glasses were dyed using gamma rays going through the glass structure. It added an exquisite dark touch to the glass.

# Nowhere to run?

The process of radiation impact on the body is called exposure to radiation. During the exposure to radiation the destructive energy of radiation is transmitted to the cells which are modified and destroyed. The exposure to radiation can modify DNA and lead to genetic damage and mutation.

**The higher is the level of radiation and the longer is the exposure time, the higher is the risk.** Several severe and serious diseases, such as acute radiation syndrome, infertility, central nervous system disturbances, immune system diseases, metabolic disorders and, of course, malignant tumours are caused by exposure to radiation. Even low doses of radiation can cause these diseases.

**Oncological diseases are the curse of our time. Every year they claim almost 8 million lives. According to doctors' forecasts, if we fail to change the situation, 17 million people will die from cancer every year by 2030.**

The fear for their health sometimes makes people take emergency measures which can be quite dangerous. For instance, after the accident in Fukushima nuclear power plant in Japan in spring 2011 uncontrolled administration of iodine-containing medications dramatically increased. There was a real medication buying frenzy in drugstores in the area close to the place of accident. All stocks of iodine-containing medications were sold out; a package of 14 pills of calcium iodide was sold in an online auction at several hundred dollars. The situation was similar in China, Australia, Malaysia, Philippines and in other countries of the Pacific region.

**WHO experts made a statement that iodine-containing medications cannot be used as radiation antidotes as they only protect from iodine radioactive isotopes.**

The overdose of the medications can cause severe complications, especially in pregnant women and people suffering from chronic diseases, e.g., renal failure.

Another device against radiation – home dosage meters show the risk level, but cannot protect from radiation. They are extremely useful in shops, markets or in case of radiation monitoring in residential units. However, the enemy must be not only found, but also neutralized.

There is a saving liner in the sea of radiation discussed by scientists so often: in 2011 Company Vision offered a solution in the struggle with radiation consequences – a new product-specialist **D i Guard nano**.

**The fighter called D i Guard nano has become a timely answer to the danger everyone is exposed to. A new biologically active supplement contains a unique combination of active components – chlorellas and opuntias, and a complex or vital vitamins and amino acids.**

**Chlorella** is a simple single-celled alga with prominent features. A tiny chlorella contains by 5-10 times more chlorophyll that medic. Moreover, it is extremely rich in nutritive substances.

It is well-known that chlorophyll has antiseptic and regenerative features and it is an efficient agent which helps struggle with anaemia, has a beneficial impact on digestive system, gives significant support to heart-vascular system and prevents neoplasms.

# Natural

The material that makes chlorella walls helps excrete toxins from the body, including heavy metals and pesticides. Beta-carotene contained by alga is used to prevent neoplasms. The combination of substances including nucleic and amino acids, peptides,

vitamins and sugar – so-called chlorella growth factor – is responsible for anti-mutation processes and tissue regeneration in the body.

Another amazing component of the biologically active supplement **D i Guard nano** is **opuntia**, a Mexican plant that belongs to cactus family. It has pronounced antibacterial and antiseptic features, it strengthens protective forces of the body and helps

struggle the adverse environmental factors, including radiation.

# bodyguard

In addition to the main function, protection from radiation impact, the ingredients of BAFS **D i Guard nano** may help to:

- excrete toxins and heavy metals from the body;
- strengthen the immune system contributing to improvement of the general health state;
- stimulate the digestion;
- support the work of liver and gall bladder;
- help overcome the hangover syndrome.

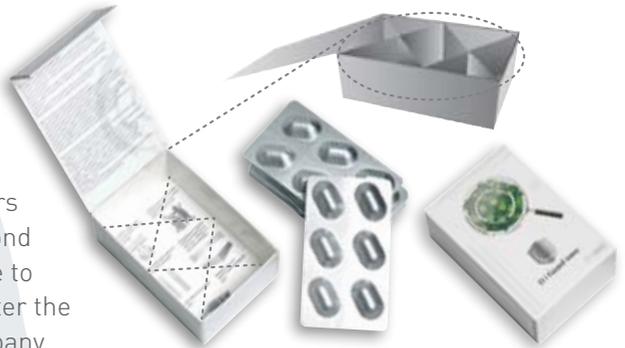

# Innovative D i Guard nano Package

**Innovative package of the BAFS  
D i Guard nano embodies the  
concept of Second Life.**

The Company Vision, which takes care of the global ecology, offers a present to its distributors and clients. The concept of Second Life allows giving the second life to the packaging. You can use it after the product is consumed. The Company covers the packaging production costs and does not include them in the product's ultimate price for distributors and clients.

The additional bottom of the box in the form of a folding grate can be used as a pillbox when there are no more capsules left. For your convenience the packaging is equipped with a magnet to fix the cover and a sticker to personalize the pillbox.

**D i Guard nano capsules are packed  
in two-sided aluminium push-through  
pack which was created using  
ALU-ALU technology.**

It guarantees full protection of biologically active supplement components from destructive impact of ultraviolet light and preservation of useful properties of the product in case of high humidity and temperature level. Moreover, this packaging makes the product administration convenient according to strict hygienic requirements.
